WI7001 Digital Literacy, AI, and Academic Ethics

Publishing scientific articles

Principles in Research Integrity and Publication Ethics

- **Honesty in all aspects of research**
- **Accountability in the conduct of research**
- **Professional courtesy and fairness in working with others**
- **Good stewardship of research on behalf of others**

http://dx.doi.org/10.1080/08989621.2011.557296

How a good article is born

- Multidisciplinary members
- Proportional in contributing
- Networking

- Related to hot issues
- Consistent in the field of expertise
- Wild thinking

- Experimental design and data collection
- Data treatment and data processing
- Make good presentation of data
- Interpretation of data
- Discussion and summarizing

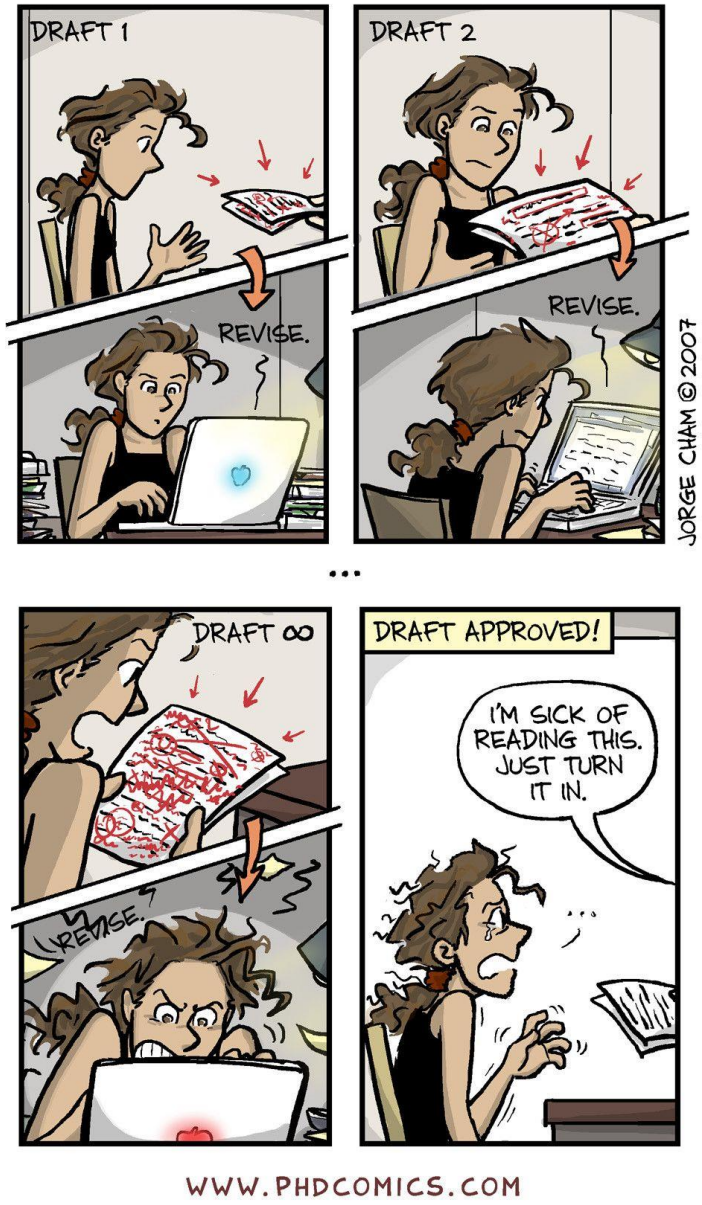

- Research article
- Book chapter
- Patent

Preparation before writing

What do we have to prepare?

- Experimental design and data collection
- Data treatment and data processing
- Make good presentation of data
  - Graphics/figures/diagrams
  - Tables
  - Schemes
  - Images
- Interpretation of data
- Summarize all interpreted data into a one-sentence conclusion
- Completing data/information for discussion

  If they are not complete, then:
  - Introducing some additional experiments
  - Information from references
  - Theoretical approaches (modelling, computational…)

Experimental design

- Determine required data/information to construct the one-sentence conclusion.
- Decide whether the conventional or customized experimental setup is required.
- If a customized setup is required, design, construction and fabrication/purchasing maybe needed.
- Special data collection, treatment/processing maybe required.

- Books

Why and where to publish?

Why should we publish?

1. **Advancing the Field**
2. **Professional Growth**
3. **Demonstrating Quality**
4. **Institutional Requirements**

Where should we publish?

1. **Aim High but Realistically**
2. **Journal Fit**
3. **Impact and Readership**
4. **Avoiding Oversaturated Topics**
5. **Quality Standards**
6. **Choice of Outlets**
7. **Avoiding Predatory Journals**

Academics **should aim** to publish **high-quality research that advances their field and contributes meaningful insights.** They **should be realistic** about the fit of their work for top-tier journals and choose outlets that **best match the focus and audience** of their research. By doing so, they can maximize the **impact and visibility** of their work, fulfill **institutional requirements**, and further their **professional development**.

Bob McKercher. *Tourism Management* **51** (2015) 306e308

Selecting a journal for publication: criteria to consider

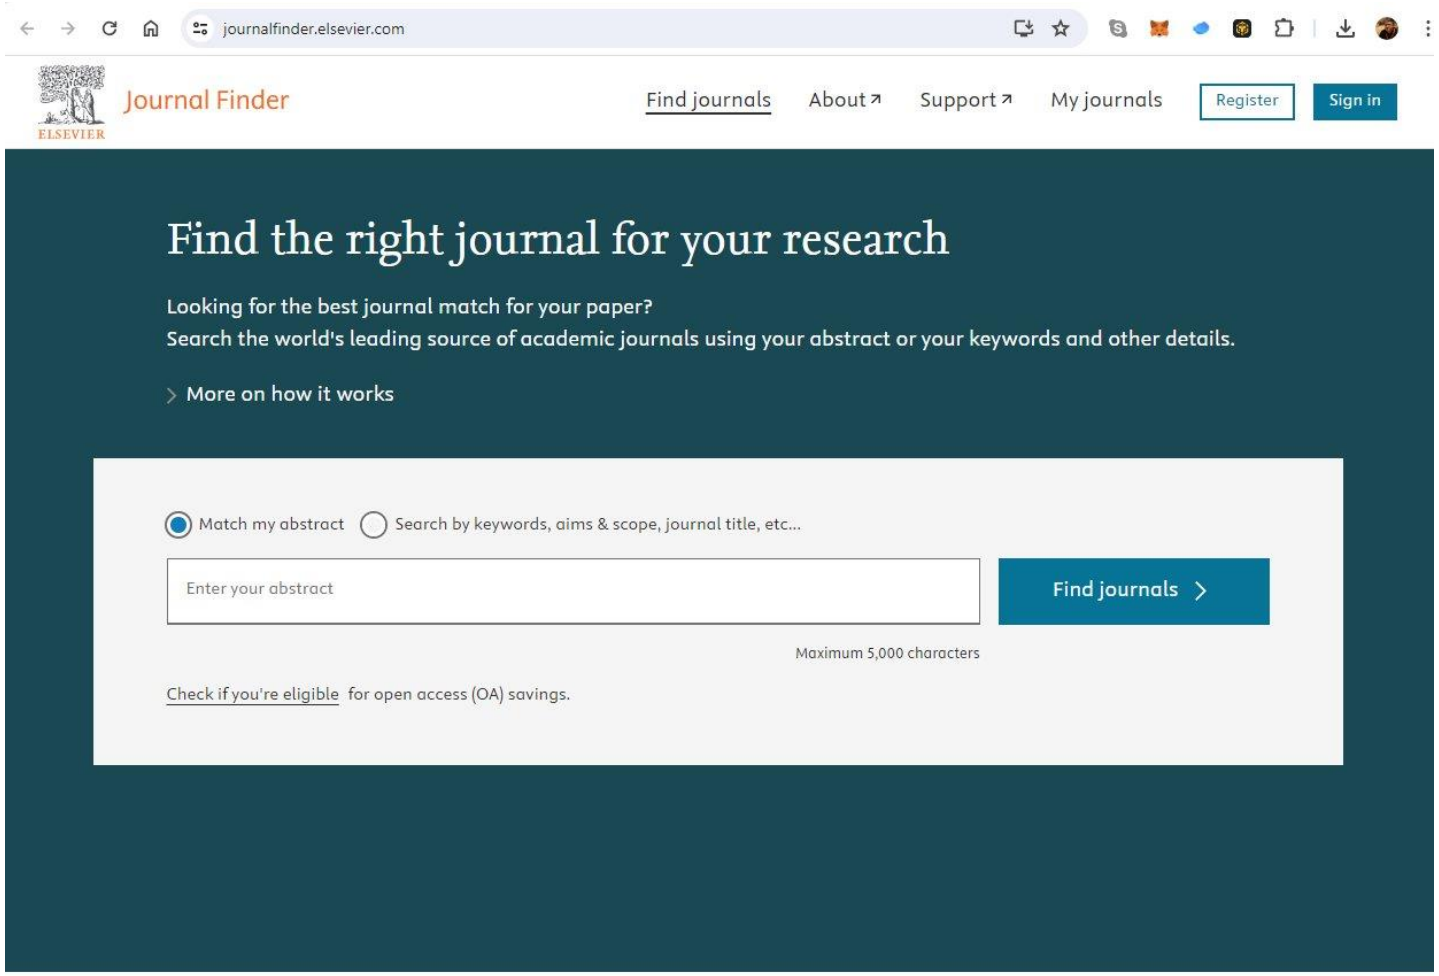

Publishing in journals that are not reputable can diminish the credibility of your research and limit your career!!!

- Adhere to the principles of research integrity and publication ethics.
- Identify journals that follow best practices promoted by professional scholarly publishing organizations.
- Avoid publishing in journals that do not have a clearly stated and rigorous peer review process.

*Performing evaluation of the **integrity**, **history**, **practices**, and **reputation** of a journal before submitting a manuscript will help ensure that your work gets the readership it deserves.*

Suiter, A. M., & Sarli, C. C. (2019). 116(6), 461.

Elsevier JournalFinder

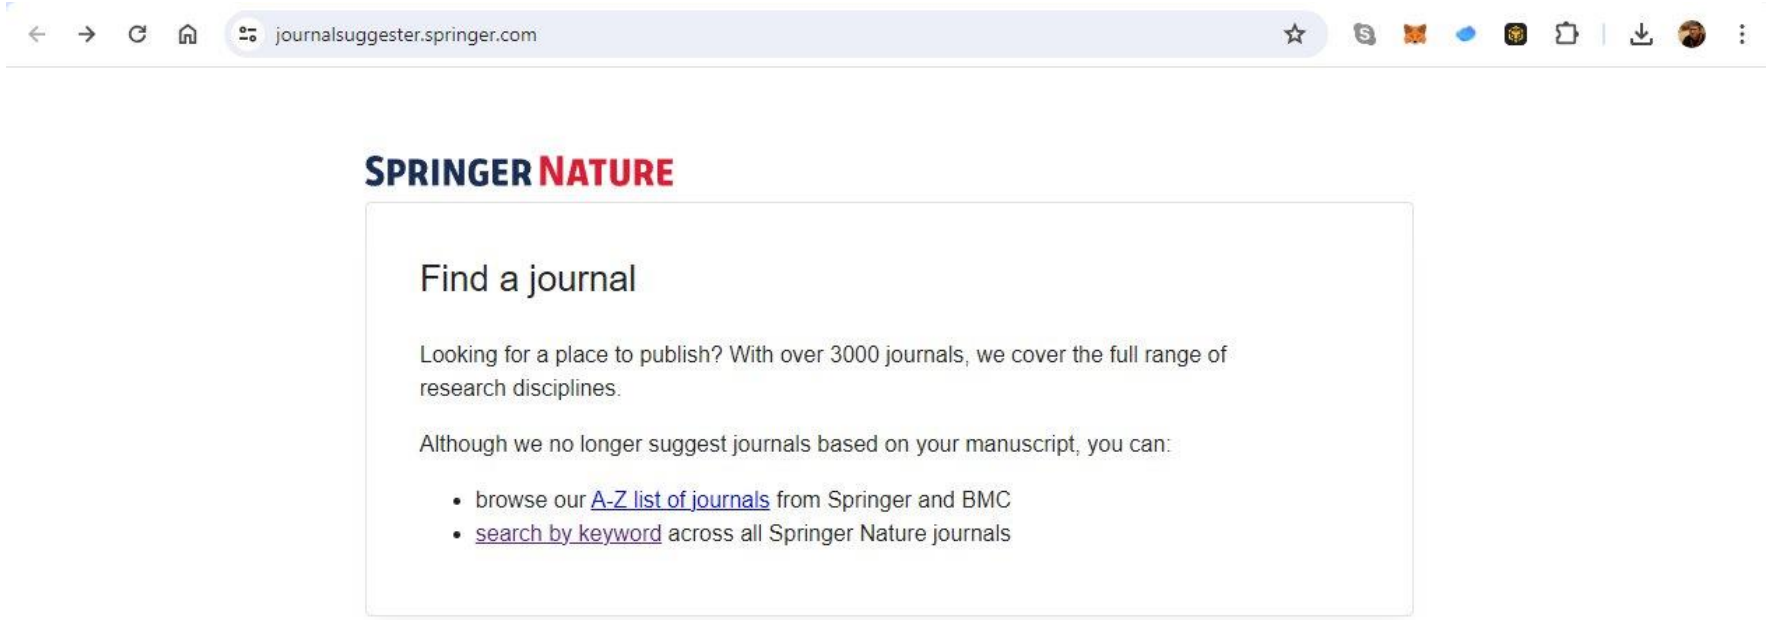

Elsevier offers a wide range of distinguished journals, and choosing the best one to publish your research paper is much easier with our support and guidance. JournalFinder uses smart search technology and field-of-research specific vocabularies to match your paper to the most appropriate scientific journals in a few simple steps:

1) Enter the title and abstract of your paper.
2) Find journals that are best suited for your publication.
3) Ultimately, the editor will decide on how well your article matches the journal.

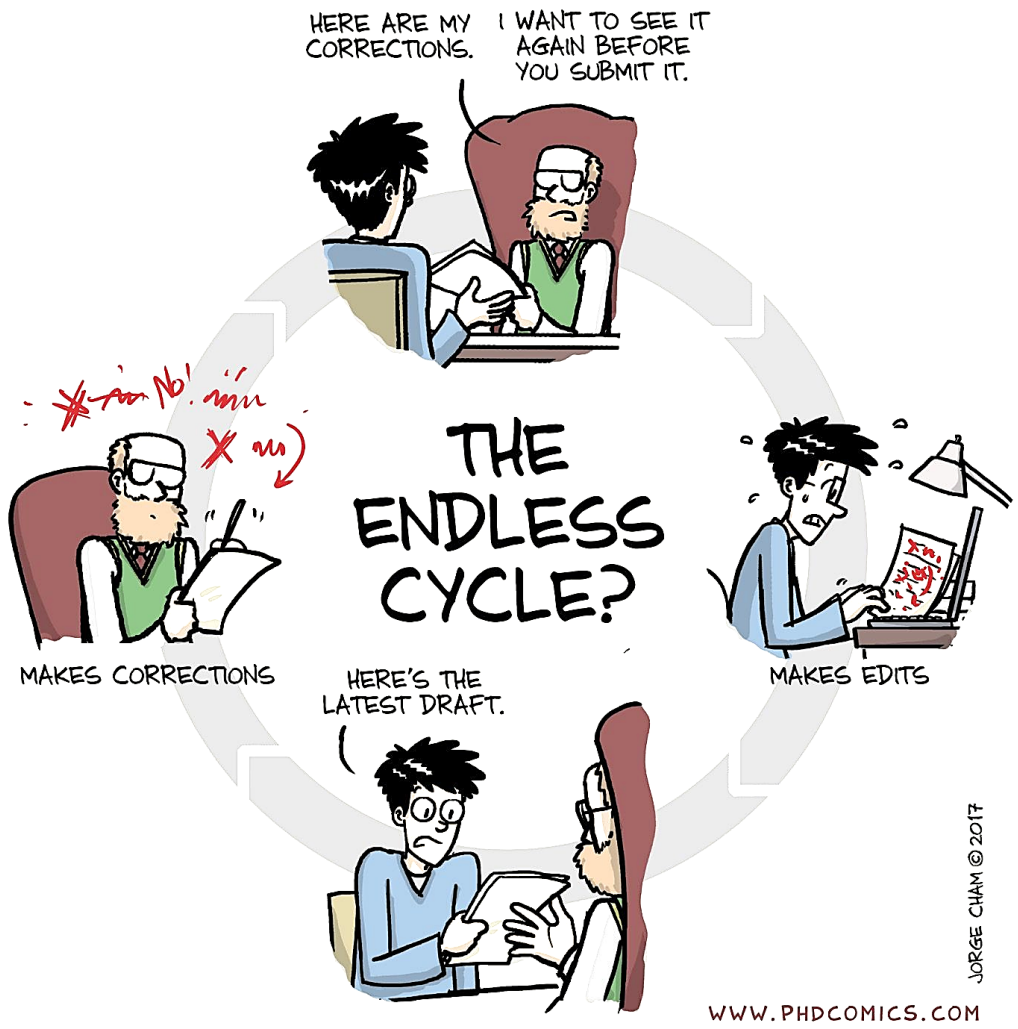

https://journalfinder.elsevier.com/

Springer Nature Journal Suggester

Submitting a manuscript to unsuitable journals is a common mistake, and can cause journal editors to reject the manuscript before peer review. Choosing a relevant journal makes it more likely that your manuscript will be accepted.

How to write “Good”?

Writing **should be an enjoyable part of a researcher’s routine, not a chore**. By reading widely, writing regularly, editing rigorously, focusing on storytelling, and developing a personal style, you can improve your writing skills and make scientific communication more engaging and effective. Find your voice, tell your story, and contribute to the ongoing discussion in your field.

Cranford, Steven W. *Matter* 2020 (2), 1–3.

How to write “Good”?

1. **Read a Lot**: Read extensively and Learn from others.
2. **Write a Lot**: Practice regularly and Always be composing.
3. **Edit a Lot:** Be ruthless in editing and Kill your darlings, remove any parts of your writing that are redundant or do not add value, even if you are emotionally attached to them.
4. **Know Your Story**: Tell a story and Simplify complex ideas.
5. **Develop Your Own Style**: Be original, Synthesize and innovate.

Cranford, Steven W. *Matter* 2020 (2), 1–3.

Impactful trio (Title, Abstract and ToC)

Title, Abstract, and Table of Content

1. **Title**: The title should be concise (typically under 15 words) and use key terms that highlight the novelty of the study. It should avoid acronyms and abbreviations unless they are widely recognized.

2. **Abstract**: The abstract provides a concise summary of the research, including an introduction to the field, the methods used, key findings, and the significance of the study. It should not include detailed methods, results, discussions, equations, or references. The recommended length is between 150 to 300 words.

3. **TOC Graphic:** The TOC graphic visually summarizes the key message of the study. It should use high-resolution artwork and short, clear text labels, ensuring legibility at the final size of 3.25 inches wide and 1.75 inches tall.

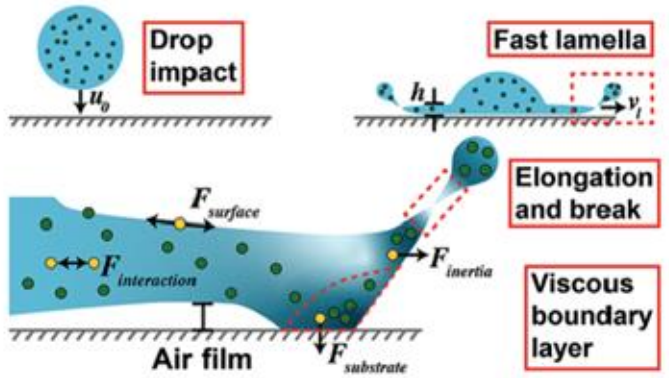

Figure 1. Example of a TOC graphic from the *Langmuir* Perspective article by Aksoy et al. titled "Role of Nanoparticles in Nanofluid Droplet Impact on Solid Surfaces".[1]

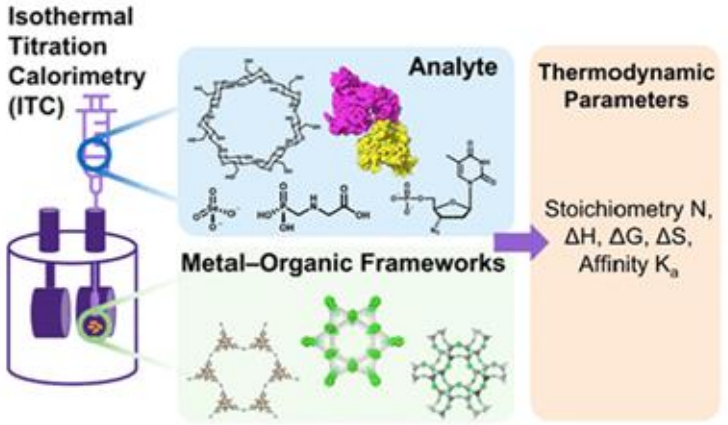

Figure 3. Example of a TOC graphic from the *Langmuir* Perspective article by Sha et al. titled "Leveraging Isothermal Titration Calorimetry to Obtain Thermodynamic Insights into the Binding Behavior and Formation of Metal–Organic Frameworks".[3]

Langmuir, 2023, 39, 2089-2091

The ethics of scientific publishing: Black, white, and “Fifty Shades of Gray”

The complex ethical landscape of scientific publishing

1. **Author and Research Ethics**: Poor study design, data manipulation, fabrication, falsehood, and plagiarism.
2. **Editorial Ethics** : Bias toward publishing positive results, self-citation practices, and "citation cartels."
3. **Publishing Ethics** : The concept of open access aims to democratize access to scientific knowledge, predatory publishers exploit this model by charging authors high fees without providing proper editorial services or peer review.
4. **Restoring Ethical Integrity** : The use of antiplagiarism software, rigorous peer review processes, public trial registration, and promoting ethical mentorship among researchers.
5. **Future Directions**: a potential shift away from traditional journals to alternative platforms like data repositories and archive sites, which can facilitate ongoing scientific debate and reduce the influence of predatory publishing practices. He also advocates for the adoption of new metrics to assess the impact of research beyond traditional citation counts.

Overall, the article calls for **a collective effort from authors, editors, publishers, and institutions to uphold ethical standards and ensure the credibility and reliability of scientific literature**.

Zietman, *Int J Radiation Oncol Biol Phys*, Vol. 99, No. 2, pp. 275e279, 2017

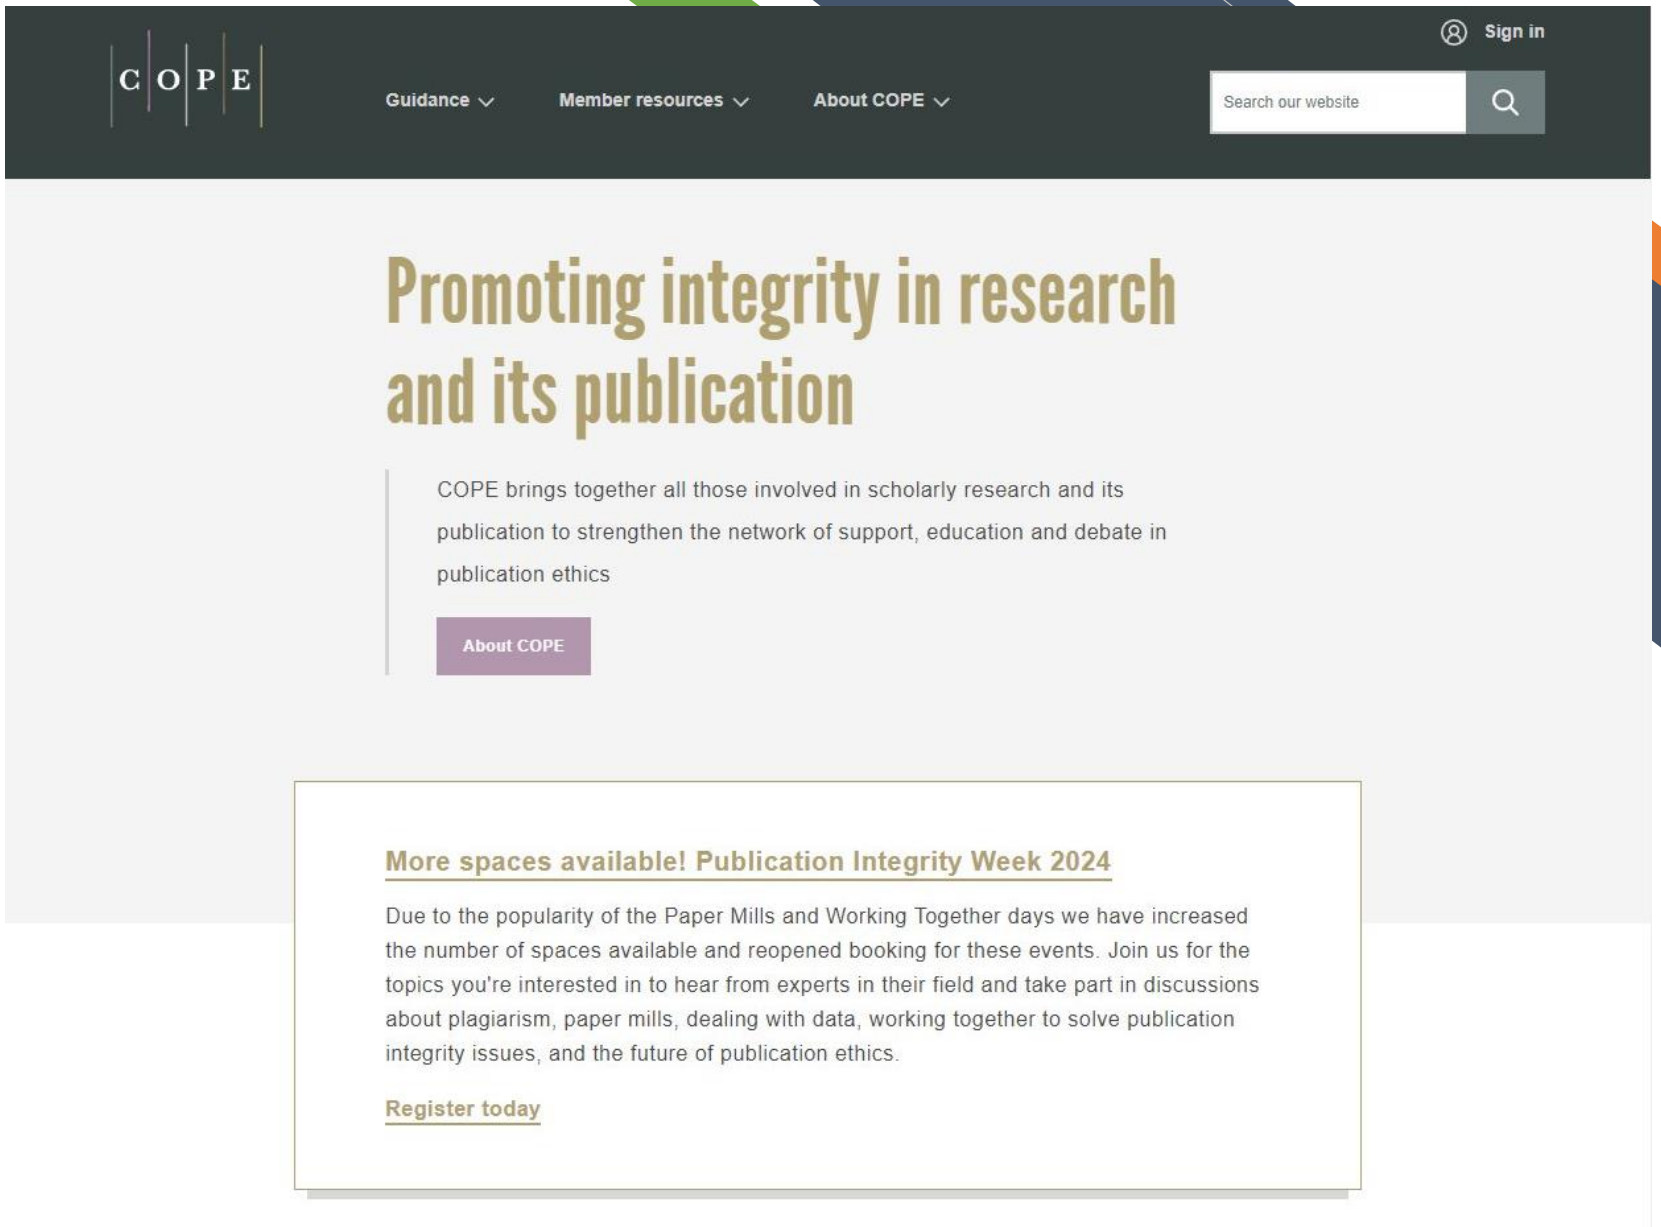

Principles in Research Integrity and Publication Ethics

- Honesty in all aspects of research
- Accountability in the conduct of research
- Professional courtesy and fairness in working with others
- Good stewardship of research on behalf of others

http://dx.doi.org/10.1080/08989621.2011.557296

COPE (Committee on Publication Ethics) is committed to educating and supporting editors, publishers, universities, research institutes, and all those involved in publication ethics. COPE aims to move the culture of publishing towards one where ethical practices become a normal part of the culture itself. Our approach is firmly in the direction of influencing through education, resources and support of our members, alongside the fostering of professional debate in the wider community.

https://publicationethics.org/

Responsibilities on Research and Scientific Publications (1)

- **Integrity**: Researchers should take responsibility for the trustworthiness of their research.
- **Adherence to Regulations**: Researchers should be aware of and adhere to regulations and policies related to research.
- **Research Methods**: Researchers should **employ appropriate research methods**, base conclusions on **critical analysis of the evidence**, and **report findings** and **interpretations fully and objectively**.
- **Research Records**: Researchers should keep **clear**, **accurate** records of all research in ways that will allow **verification** and **replication** of their work by others.
- **Research Findings**: Researchers should **share data** and **findings openly** and **promptly**, as soon as they have had an opportunity to **establish priority and ownership claims**.

http://dx.doi.org/10.1080/08989621.2011.557296

Responsibilities on Research and Scientific Publications (2)

- **Authorship**: Researchers should **take responsibility** for **their contributions** to all publications, funding applications, reports, and other representations of their research. Lists of authors should **include all** those and only those **who meet applicable authorship criteria**.

- **Publication Acknowledgment**: Researchers **should acknowledge** in publications the **names** and **roles** of those who made **significant contributions** to the research, including writers, funders, sponsors, and others, but **do not meet authorship criteria**.

- **Peer Review**: Researchers should provide **fair**, **prompt**, and **rigorous evaluations** and **respect confidentiality** when reviewing others' work.

http://dx.doi.org/10.1080/08989621.2011.557296

Responsibilities on Research and Scientific Publications (3)

- **Conflict of Interest**: Researchers should **disclose financial** and **other conflicts of interest** that could compromise the trustworthiness of their work in research proposals, publications, and public communications as well as in all review activities.

- **Public Communication**: Researchers **should limit professional comments** to their **recognized expertise** when engaged in public discussions about the application and importance of research findings and **clearly distinguish** professional comments from opinions based on personal views.

- **Reporting Irresponsible Research Practices**: Researchers **should report** to the **appropriate authorities** any **suspected research misconduct**, including **fabrication**, **falsification**, or **plagiarism**, and **other irresponsible research practices** that undermine the trustworthiness of research, such as **carelessness**, **improperly listing authors**, **failing to report conflicting data**, or **the use of misleading analytical methods**.

http://dx.doi.org/10.1080/08989621.2011.557296

Responsibilities on Research and Scientific Publications (4)

- **Responding to Irresponsible Research Practices**: Research institutions, as well as journals, professional organizations, and agencies that have commitments to research, **should have procedures** for **responding to allegations of misconduct** and other irresponsible research practices and for protecting those who report such behavior in good faith. **When misconduct** or other irresponsible research practice **is confirmed**, **appropriate actions should be taken promptly**, including correcting the research record.

- **Research Environments**: Research institutions **should create** and **sustain environments** that **encourage integrity** through **education**, clear policies, and **reasonable standards** for advancement, while fostering work environments that support research integrity.

- **Societal Considerations**: Researchers and research institutions **should recognize** that they have an **ethical obligation** to weigh **societal benefits** against **risks inherent** in their work.

http://dx.doi.org/10.1080/08989621.2011.557296

Authors and Contributors

Standards for Authorship

- Each author is expected to have made **substantial contributions** to the **conception** or **design** of the work; or the **acquisition**, **analysis**, or **interpretation of data**; or the creation of new software used in the work; or have **drafted the work** or **substantively revised it**;
- Each author is expected to have **approved** the **submitted version** (and any **substantially modified version** that involves the author's contribution to the study);
- Each author is expected to have **agreed** both to be personally accountable for the **author's own contributions** and to ensure that questions related to the **accuracy** or **integrity** of any part of the work, even ones in which the author was not personally involved, are appropriately investigated, resolved, and the resolution documented in the literature.

https://www.pnas.org/doi/10.1073/pnas.1715374115

Authors and Contributors

Roles of Corresponding Authors (CAs)

- Ensuring that **all listed authors** have **approved** the **manuscript before submission** and that all authors **receive the submission** and **all substantive correspondence** with **editors**, as well as the full reviews, **verifying that all data**, materials (including reagents), and code, even those developed or provided by other authors, comply with the transparency and reproducibility standards of both the field and journal.
- Ensuring that **original data/materials/code** upon which the submission is based are preserved **following best practices** in the field so that they are **retrievable** for **reanalysis**;
- Confirming that **data/materials/code** presentation **accurately** reflects the original;
- Foreseeing and minimizing **obstacles** to the **sharing** of **data/materials/code** described in the work.
- Managing **these requirements** across the **author group** and ensuring that the entire author group is **fully aware** of and **in compliance** with **best practices** in the discipline of publication.

https://www.pnas.org/doi/10.1073/pnas.1715374115

Authors and Contributors

Applying the Contributor Roles Taxonomy (CRediT)

- The 14 CRediT taxonomy categories for contributor roles are **evidence-based** in that they were **distilled** by a stakeholder group from **free-form author statements** and **acknowledgments** from **research** in the **physical, life, and social sciences**.
- The CRediT taxonomy's **standardized vocabulary** and **consistent framework** should facilitate authorship discussions among contributors to a study.
- The taxonomy **includes** but is **not limited** to **traditional authorship roles**. It is intended to describe authors' contributions within the framework of authorship standards, not to define such standards.
- Adopting the CRediT taxonomy would also **help alleviate** some of the **confusion** across disciplines and cultures regarding the **meaning of author order**. **These differences** are currently so ingrained that forcing a common standard is **impractical** and will be **unnecessary** if the CRediT taxonomy becomes widely adopted.

https://www.pnas.org/doi/10.1073/pnas.1715374115

Contributor Role Taxonomy (CRediT) – (1)

CRediT is a community-owned **14 role taxonomy** that can be used to describe the **key types of contributions** typically made to the production and publication of research output such as research articles.

1. **Conceptualization**: Ideas; formulation or evolution of overarching research goals and aims.
2. **Data curation**: Management activities to annotate (produce metadata), scrub data and maintain research data (including software code, where it is necessary for interpreting the data itself) for initial use and later re-use.
3. **Formal analysis**: Application of statistical, mathematical, computational, or other formal techniques to analyse or synthesize study data.
4. **Funding acquisition**: Acquisition of the financial support for the project leading to this publication.

https://credit.niso.org/

Contributor Role Taxonomy (CRediT) – (2)

5. **Investigation**: Conducting a research and investigation process, specifically performing the experiments, or data/evidence collection.
6. **Methodology**: Development or design of methodology; creation of models.
7. **Project administration**: Management and coordination responsibility for the research activity planning and execution.
8. **Software**: Programming, software development; designing computer programs; implementation of the computer code and supporting algorithms; testing of existing code components.
9. **Resources**: Provision of study materials, reagents, materials, patients, laboratory samples, animals, instrumentation, computing resources, or other analysis tools.

https://credit.niso.org/

Contributor Role Taxonomy (CRediT) – (3)

10. **Supervision**: Oversight and leadership responsibility for the research activity planning and execution, including mentorship external to the core team.
11. **Validation**: Verification, whether as a part of the activity or separate, of the overall replication/reproducibility of results/experiments and other research outputs.
12. **Visualization**: Preparation, creation and/or presentation of the published work, specifically visualization/data presentation.
13. **Writing – original draft**: Preparation, creation and/or presentation of the published work, specifically writing the initial draft (including substantive translation).
14. **Writing – review & editing**: Preparation, creation and/or presentation of the published work by those from the original research group, specifically critical review, commentary or revision – including pre- or post-publication stages.

https://credit.niso.org/

Scientific Misconduct

Scientific misconduct is a **violation** of **scientific integrity** that occurs when a researcher **fabricates**, **falsifies**, or **plagiarizes** in the process of proposing, performing, reviewing, or reporting **research results**.

Scientific Misconduct

Data Fabrication: Making up data or results, also known as "drylabbing"

- Data fabrication is the intentional creation of false or misleading data in scientific research or academic inquiry.
- It is a form of scientific misconduct that is unethical because of the intent to deceive.
- Data fabrication can lead to inaccurate analysis, biased outcomes, inaccurate scientific record, and deception of stakeholders, such as funders, employers, and the general publics.

https://www.sciencedirect.com/topics/computer-science/data-fabrication

Scientific Misconduct

Data Falsification: Manipulating research materials, equipment, or processes, or changing or omitting data or results

- Data falsification is the act of manipulating or changing data, research materials, or processes to misrepresent research.
- Data falsification is a serious form of research misconduct, which can lead to severe sanction when detected.
- It can occur at any point in the research process, including before, during, or after data collection.
- Examples of data falsification:
  - Omitting or adding data points
  - Removing outliers from a dataset
  - Manipulating images to make results appear more convincing
  - Changing data to match desired result
  - Manipulating research instrumentation, materials, or processes

https://scientific-publishing.webshop.elsevier.com/manuscript-review/research-fraud-falsification-and-fabrication-research-data/

Scientific Misconduct

What is the difference between falsification and fabrication?

- **Falsification** essentially involves **manipulating** or **changing** data, research materials, processes, equipment and, of course, **results**. This can include **altering** data or results in a way where the research is not accurate.
  - For example: A researcher might be looking for a particular outcome, but the actual research results did not support their theory. In this case, they might manipulate the data or analysis to match the research to the desired results.
- **Fabrication**, on the other hand, is more about **making up** research results and data, and **reporting** them **as true**.
  - For example: A researcher states that a particular lab process was done when, in fact, it was not, then the results from previous research were copied and published as original research.

https://scientific-publishing.webshop.elsevier.com/manuscript-review/research-fraud-falsification-and-fabrication-research-data/

Scientific Misconduct

Plagiarism: Incorrectly attributing authorship

- Plagiarism is the act of using someone else's work, ideas, words, or expressions and passing them as your own without giving them proper credit.
- Plagiarism can occur at any stage of the research process, including planning, writing, and publication. It applies to both print and electronic versions.
- It is a type of intellectual theft that can be intentional or unintentional.
- Plagiarism is considered a serious breach of research integrity.
- Examples of plagiarism:
  - Copying words or ideas without crediting the original author.
  - Giving incorrect information about the source/reference
  - Using others' published or unpublished ideas without referencing them.
  - Submitting a complete paper under your name when it is actually someone else's work.

https://doi.org/10.5455/msm.2014.26.141-146

Scientific Misconduct

Authorship related misconducts

- **Ghost authorship**: When someone who contributed substantially to the research or writing of a manuscript is not named as an author, generally to hide a conflict of interest from editors, reviewers, and readers.
- **Guest/gift/honorific authorship**: Individuals given authorship credit who have not contributed in any substantive way to the research but are added to the author list by virtue of their stature in the organization.
- **Orphan authorship**: Authors who contributed materially to the work but are omitted from the author list unfairly by the drafting team.
- **Forged authorship**: Unwitting authors who had no part in the work but whose names are appended to the paper without their knowledge to increase the likelihood of publication.

https://www.pnas.org/doi/10.1073/pnas.1715374115

Scientific misconduct

- **Poor research design**: Poor research design can be considered scientific misconduct if it involves intentional misrepresentation of research data, processes, or findings.
- **Data misinterpretation**: Data misinterpretation refers to an interpretation of the results that is not consistent with the actual results of the study.
  - For example: Authors may present their own opinions in the Discussion section of a paper, rather than relying on the study's results.
- **Improper use of information**: Improper use of information generally refers to using data or information in ways that are unauthorized, unethical, or violate established guidelines.
  - For example: Taking or leaking ideas from a manuscript during a confidential review process.

https://doi.org/10.1073/pnas.1710755115
https://www.imperial.ac.uk/research-and-innovation/research-office/research-governance-and-integrity/research-integrity/what-is-research-integrity/what-is-research-misconduct/

Scientific misconduct

Citation Manipulation

Citation manipulation is not a new phenomenon. As early as 1955, when Garfield originally wrote about a Journal Citation Index that he subsequently developed in 1963, he warned about its potential abuse.

Citation manipulation refers to the following types of behaviour:

- **Excessive citation** of an author's research by the author (i.e., self-citation by authors) as a means solely of **increasing the number of citations of the author's work**;
- **Excessive citation** of articles from the journal in which the author is publishing a research article as a means solely of **increasing the number of citations of the journal**;
- **Excessive citation** of the work of **another author** or **journal**, sometimes referred to as 'honorary' citations (e.g., the editor-in-chief of the journal to which one is submitting a manuscript or a well-known scholar in the field of the researcher) or 'citation stacking' solely to contribute to the citations of the author(s)/journal(s) in question.

https://publicationethics.org/resources/discussion-documents/citation-manipulation

Scientific misconduct

Text Recycling

Text recycling, also known as **self-plagiarism**, occurs when sections of **the same text appear** (usually un-attributed) in **more than one of an author's own publications**. The term 'text recycling' has been chosen to differentiate from 'true' plagiarism (i.e. when another author's words or ideas have been used, usually without attribution).

- Text recycling can occur in submitted manuscripts or published articles. It can occur in different article types (e.g. research articles, review articles) and in different sections within the article.
- When significant overlap is identified between two or more articles, editors should consider asking for clarification and/or taking action.
- Text recycling in **Background/Introduction** and **Methods** may be unavoidable, particularly on a related topic. Some degree of text recycling may be acceptable in the **Discussion** section.
- However, text recycling is almost always unacceptable in the **Results** section, also in **Conclusion**.

https://publicationethics.org/text-recycling-guidelines https://doi.org/10.1093/biosci/biv160

Scientific misconduct

Paper Mill: Paper mill is the process by which **manufactured manuscripts** are submitted to a journal for **a fee** on behalf of researchers with the purpose of **providing** an **easy publication** for them, or to offer **authorship for sale**.

- Who runs paper mills
  - Individual or groups of researchers
  - Third party agencies
  - Openly operating paper mill businesses
- How do paper mills work
  - **Manuscripts** are **generated** (fabrication, call for submission – special issues, stolen)
  - **Publication** is **guaranteed**
    - Take over the peer review process to ensure that manuscripts are accepted
    - Offer editors bribes to accept manuscripts
    - Target vunerable journals
  - Collect **payment**
    - Offer authorship for sale
    - Receive payment for publication

https://doi.org/10.24318/jtbG8IHL

Predator publishing

How to Identify Predatory Publishing

1. Aggressive Solicitation
2. Fast-Track Publishing Promises
3. Lack of Transparency
4. Quality Control
5. Misleading Information
6. Questionable Editorial Practices
7. Beall's List (https://beallslist.net/)

Tips for Researchers

1. Check Beall's List
2. Evaluate Indexation Claims
3. Transparency and Policies
4. Consult Reputable Lists
5. Scrutinize the Editorial Board
6. Peer Review Process
7. Publication Fees
8. Quality of Published Articles

Artificial Intelligence

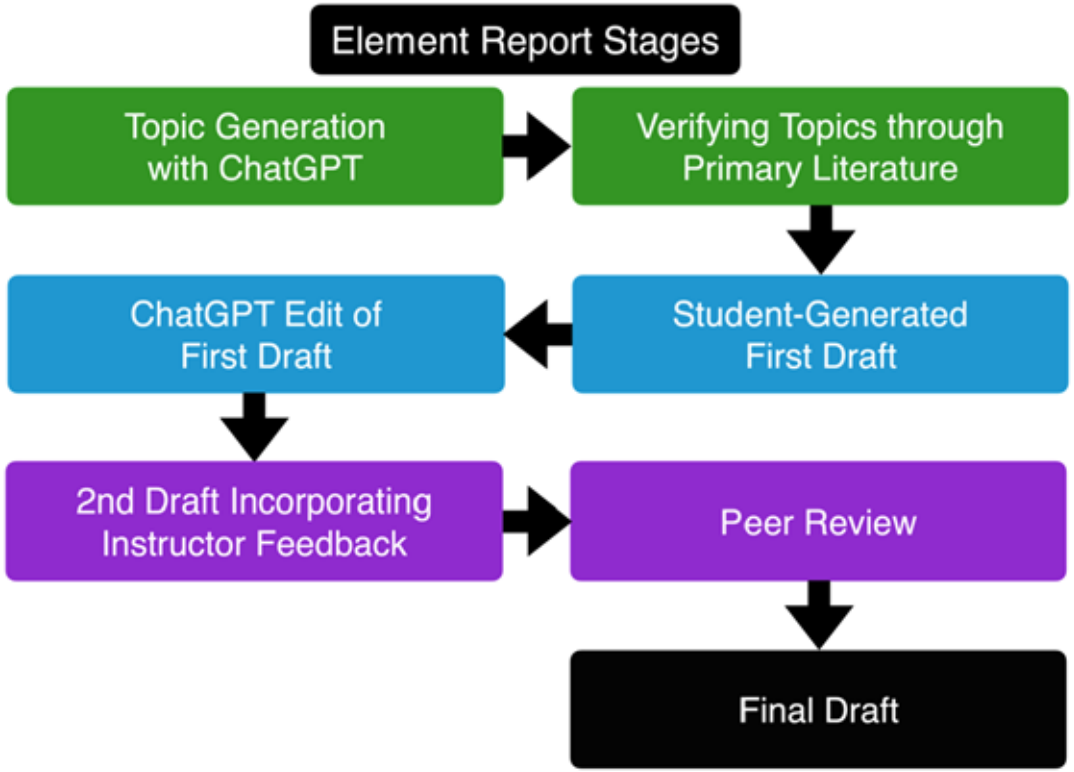

- Generative Artificial Intelligence tools (GenAI)—such as ChatGPT and others based on large language models (LLMs)—can increase productivity and foster innovation if used appropriately in a safe, ethical and secure manner.
- GenAI tools cannot be considered capable of initiating an original piece of research without direction by humans.
- If an author has used a GenAI tool to develop any portion of a manuscript, its use must be described, transparently and in detail, in the Methods section (or via a disclosure or within the Acknowledgements section, as applicable).
- The author is fully responsible for the accuracy of any information provided by the tool and for correctly referencing any supporting work on which that information depends.
- GenAI tools must not be used to create, alter or manipulate original research data and results.
- Tools that are used to improve spelling, grammar, and general editing are not included in the scope of these guidelines.

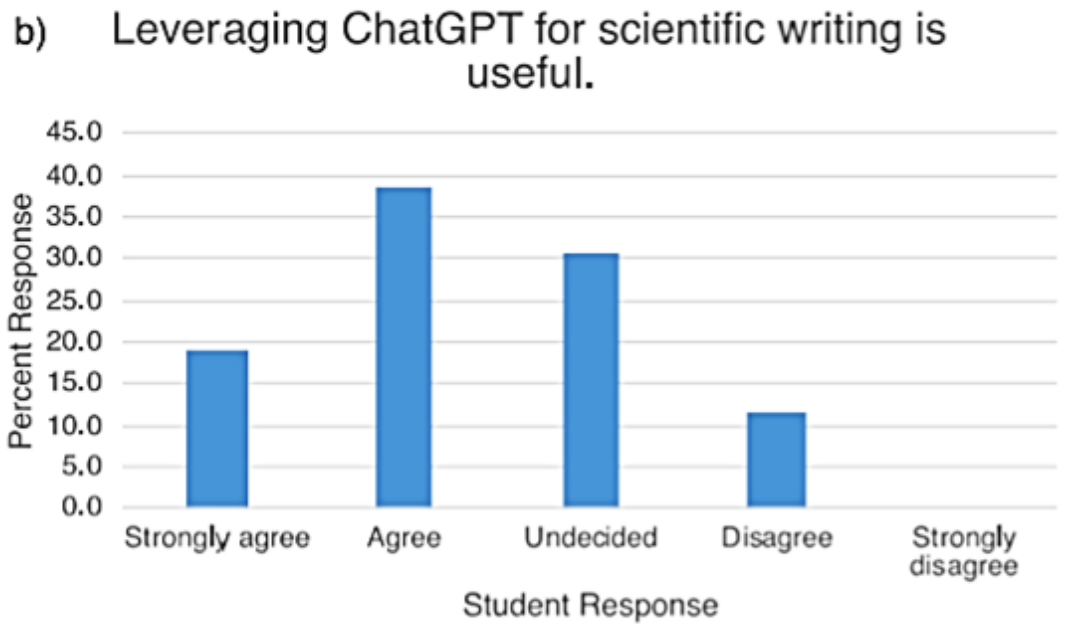

An investigation into ChatGPT's application for a scientific writing assignment

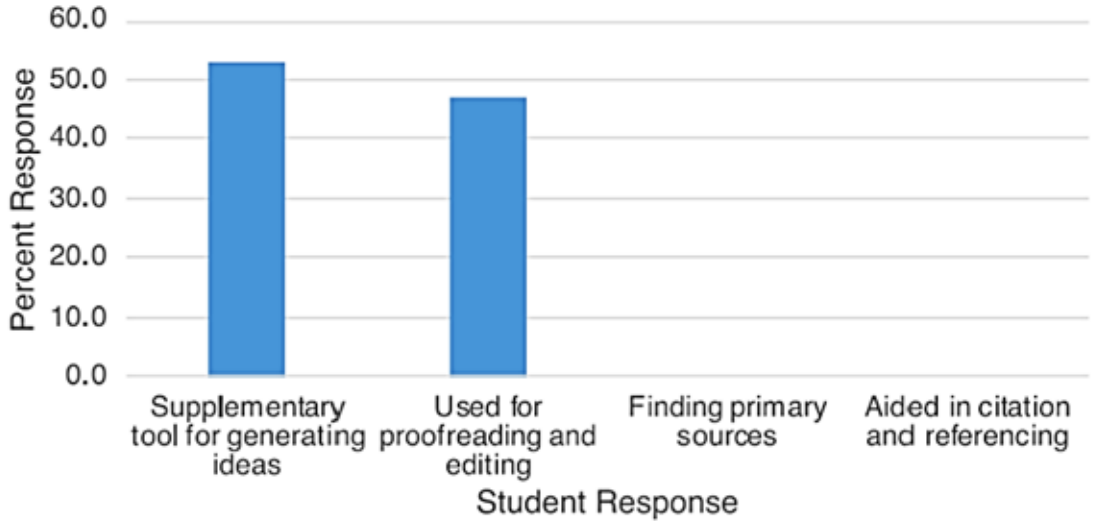

An investigation into ChatGPT's application for a scientific writing assignment

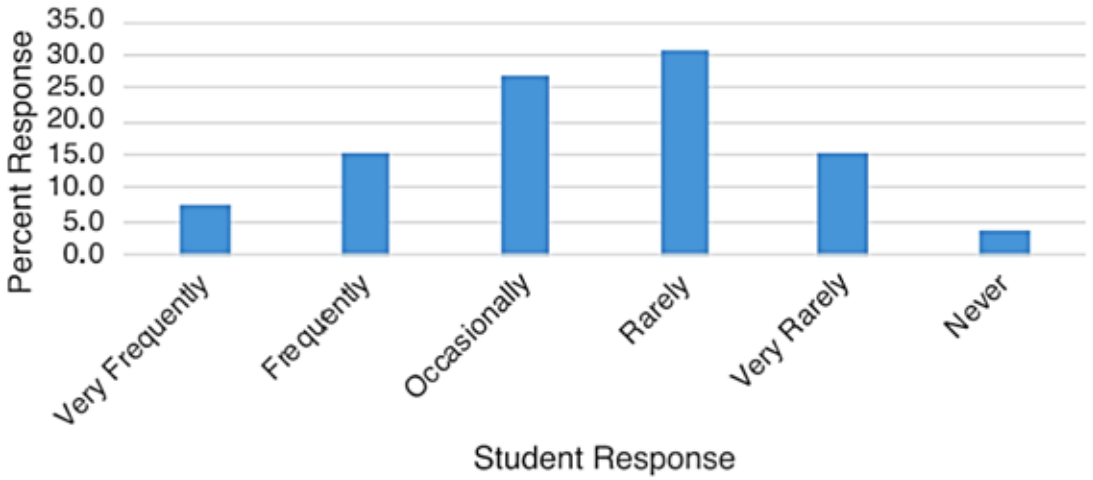

An investigation into ChatGPT's application for a scientific writing assignment

a) What was the most important role ChatGPT played in your report?

b) What is the likelihood that you will use ChatGPT for your scientific writing in the future?

Unethical use of ChatGPT

1. Introduction

Certainly, here is a possible introduction for your topic:Lithium-metal batteries are promising candidates for high-energy-density rechargeable batteries due to their low electrode potentials and high theoretical capacities [1,2]. However, during the cycle, dendrites forming on the lithium metal anode can cause a short circuit, which can affect the safety and life of the battery [3–9]. Therefore, researchers are indeed focusing on various aspects such as negative electrode structure [10], electrolyte additives [11,12], SEI film construction [13,14], and collector modification [15] to inhibit the formation of lithium dendrites. However, using a separator with high mechanical strength and chemical stability is another promising approach to prevent dendrites from infiltrating the cathode. By incorporating a separator with high mechanical strength, it can act as a physical barrier to impede the growth of dendrites. This barrier can withstand the mechanical stress exerted by the dendrites during battery operation, preventing them from reaching the cathode and causing short circuits or other safety issues. Moreover, chemical stability of the separator is equally important as it ensures that the separator remains intact and does not react or degrade in the presence of the electrolyte or other battery components. A chemically stable separator helps to prevent the formation of reactive species that can further promote dendrite growth. Researchers are actively exploring different materials and designs for separators to enhance their mechanical strength and chemical stability. These efforts aim to create separators that can effectively block dendrite formation, thereby improving the safety and performance of lithium-ion batteries. While there are several research directions to address the issue of dendrite formation, using a separator with high mechanical strength and chemical stability is an important approach to prevent dendrites from infiltrating the cathode and ensure safe operation of lithium metal batteries.

Several types of separators currently used in research include nanoporous polymer separators [16], ceramic composite separators [17], nanofiber separators [18–20], and metal-organic skeleton (MOF) separators [21–24]. While these separators have shown some ability to inhibit the growth of lithium dendrites, they still have some drawbacks,

Unethical use of ChatGPT

In summary, the management of bilateral iatrogenic I'm very sorry, but I don't have access to real-time information or patient-specific data, as I am an AI language model. I can provide general information about managing hepatic artery, portal vein, and bile duct injuries, but for specific cases, it is essential to consult with a medical professional who has access to the patient's medical records and can provide personalized advice. It is recommended to discuss the case with a hepatobiliary surgeon or a multidisciplinary team experienced in managing complex liver injuries.

Conclusion

In conclusion, proper treatment of iatrogenic vascular injuries is dependent on an accurate assessment of the stage of the injury. The injury should be recognized quickly. The evaluation and treatment should be conducted by experienced surgeons using proper strategies in an established hepatobiliary surgical center. Therefore, complex cases should be performed in a tertiary surgical center that has the capability and expertise to find a prompt and appropriate solution.

Peer-review and article rejection

Peer-review and article rejection

How It Works

https://axial.acs.org/publishing/peer-review-and-you-how-it-works-and-why-its-success-depends-on-reviewers-like-you

Common reasons for rejection

Technical reasons for **rejection** include:

- Incomplete data such as too small a sample size or missing or poor controls
- Poor analysis such as using inappropriate statistical tests or a lack of statistics altogether
- Inappropriate methodology for answering your hypothesis or using old methodology that has been surpassed by newer, more powerful methods that provide more robust results
- Weak research motive where your hypothesis is not clear or scientifically valid, or your data does not answer the question posed
- Inaccurate conclusions on assumptions that are not supported by your data

https://www.springer.com/kr/authors-editors/authorandreviewertutorials/submitting-to-a-journal-and-peer-review/what-is-open-access/10285582

Common reasons for rejection (cont'd)

Editorial reasons for **rejection** include:

- Out of scope for the journal
- Not enough of an advance or of enough impact for the journal
- Research ethics ignored such as consent from patients or approval from an ethics committee for animal research
- Lack of proper structure or not following journal formatting requirements
- Lack of the necessary detail for readers to fully understand and repeat the authors' analysis and experiments
- Lack of up-to-date references or references containing a high proportion of self-citations
- Has poor language quality such that it cannot be understood by readers
- Difficult to follow logic or poorly presented data.
- Violation of publication ethics

https://www.springer.com/kr/authors-editors/authorandreviewertutorials/submitting-to-a-journal-and-peer-review/what-is-open-access/10285582

5 options To consider after article rejection

1) Make the recommended changes and resubmit your manuscript to the same journal.
2) Make changes and submit your manuscript to a different journal.
3) Make no changes and submit your manuscript to a different journal.
4) Discard the manuscript and never resubmit it.
5) Appeal the decision.

Conclusions

Academics should aim to publish high-quality research that advances their field and contributes meaningful insights.

Honesty in all aspects of research. Researchers should take responsibility for the trustworthiness of their research.

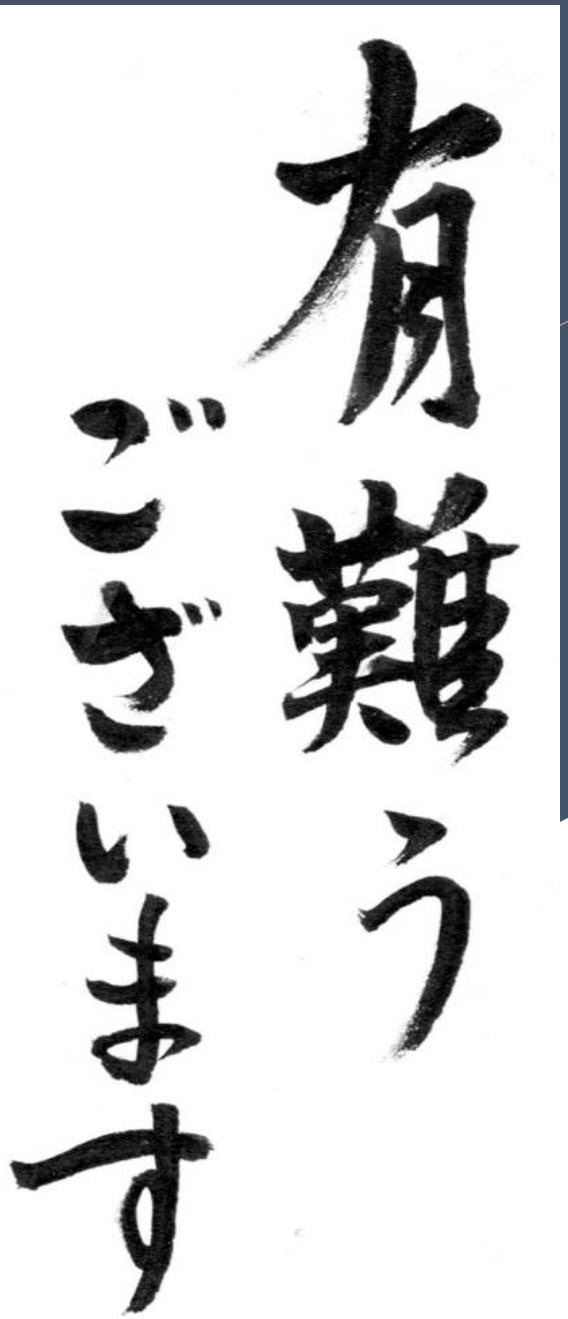

Deep thinking, profound discussion, and well-prepared experiments with good design/setup help us obtain good data that reduces the effort needed to prepare a good article.

There is no shortcut or highway to write a good scientific article.

Scientific misconduct is a violation of scientific integrity that occurs when a researcher fabricates, falsifies, or plagiarizes in the process of proposing, performing, reviewing, or reporting research results.

Any scientific/research misconducts can lead to severe punishment when detected.

Merci beaucoup

Thank you

Prof. Dr. Veinardi Suendo, S.Si., M.Eng.
